

- **Project Title:**
Offshore Equipment Maintenance & Downtime Dashboard
- **Project Type:**
Data Analytics & Dashboard Project
- **Background:**
This project was created to simulate equipment maintenance monitoring in offshore operations. The dashboard helps monitor downtime, maintenance cost, issue severity, and maintenance type across offshore platforms.
- **Tools:**
Python, Excel/CSV, Tableau Public
- **Dataset:**
Simulated offshore equipment maintenance dataset with 300 records.
- **Dashboard Features:**
 - Total downtime monitoring
 - Maintenance cost tracking
 - equipment downtime analysis
 - Corrective vs preventive maintenance
 - Severity breakdown
 - Platform downtime comparison
 - Problem equipment detail table

Key Insights:

1. Diesel Engine recorded the highest total downtime.
2. Diesel Engine also generated the highest maintenance cost.
3. Platform Bravo had the highest downtime among all platforms.
4. Corrective maintenance occurred more frequently than preventive maintenance.
5. Critical issues still need closer monitoring.

Recommendations:

1. Prioritize preventive maintenance for Diesel Engine and Crane.
2. Evaluate equipment reliability on Platform Bravo.
3. Reduce corrective maintenance by improving preventive maintenance planning.
